The 2010 Dietary Guidelines highlights fiber as one of the main nutrients lacking in the typical American diet.

Studies show that diets high in fiber can improve overall diet, help lower cholesterol, and reduce the risk of heart disease.5

- Fiber adds bulk to our food that helps us to feel fuller after eating. Research shows that both peanuts and peanut butter promote satiety and weight management due to their high content of protein and fiber.2

- Although fiber is a carbohydrate, it is not absorbed by the body and does not raise blood sugar. Research has shown that both peanuts and peanut butter can help control blood sugar in both diabetics and healthy people.3,4

- One study with kids showed that pairing peanut butter with veggies increased the amount and types of vegetables eaten.6 Meaning peanut butter can actually promote vegetable intake and high fiber foods in children.
